Banking Dashboard

Problem Statement:

Develop a basic understanding of risk analytics in banking and financial services, and understand how data is used to minimize the risk of losing money while lending to customers.

Solution:

With the help of our dashboards, which are created using Power BI's latest tool, help the company to make a decision based on the applicant's profile, like whether the applicant is likely to repay the loan, approve the loan, or not.

About the Dataset -

This dataset basically contains information about bank details, various client details, which consists of multiple tables, which are interlinked with each other through keys, like the primary key and a foreign key.

The database consists of the following tables: Banking Relationship, Client-Banking, Gender, Investment, Advisor, and Period.
